Studio Session	FRIDAY AT 2 PM

Part A: Url of the visualization

https://geniusinthemaking.github.io/FIT3179_DV2/

Part B: Domain Description

Describe your domain chosen for DV II

Books and Reading - Explore reading habits using book genres, publication years, author diversity or reader ratings. Compare the changes in reading preferences over time and investigate which genres continue to grow in population.

I decided to focus on reading preferences in Australia and also how strong library engagement is in New South Wales, and Queensland. My visualization looks at how Australians read for pleasure, how reading habits differ across generations and genders, what types of genres people prefer, and how they discover new books. I also wanted to explore how communities engage with public libraries, especially through borrowing patterns in different states of Australia.

Describe the Why and Who aspect of your DV II

WHY: The purpose of this visualisation is to help readers explore how reading habits differ across Australia and understand how communities engage with public libraries, particularly in New South Wales and Queensland. The visualisation tells a story of who reads, how libraries are used, and how reading preferences are evolving in Australia.

It allows readers to:

- Explore how recreational reading participation differs across generations and genders.
- Compare public library engagement across NSW and Queensland communities
- Identify which book categories are most frequently borrowed and how their popularity rankings have changed over time.

- Identify how Australians discover books through traditional and digital channels.

WHO: The target audience is the general public, especially individuals interested in reading habits, book preferences and public library services. This visualization could also be really helpful to researchers, academics, or even the government as it gives them insight into library borrowing patterns, popular book genres, differences in library engagement between communities, etc. This would also allow them to better understand where library services and resources may need further attention.

Describe the "What" Aspect of your DV II

Multiple datasets were used to develop this visualization.

1. Australian Bureau of Statistics (2024): How Australian's spend their time on creation and leisure activities
    a. Author: Australian Bureau of Statistics.
    b. Creation process: Data was collected through the ABS Time Use Survey, which gathers information about how Australians allocate time to different activities.
    c. Link to dataset - here
2. State library of New South Wales: Public Library Statistics (2024-2025)
    a. Author: State Library of New South Wales.
    b. Creation process: Annual statistics are collected from NSW councils and have information about library membership, visits and other library activities.
    c. Link to dataset - here
3. State library of Queensland: Queensland Public Libraries Annual Statistics, (2024-2025)
    a. Author: State library of Queensland
    b. Creation process: Annual statistics are collected from Queensland public library services and have information about library membership, collection, etc.
    c. Link to dataset - here
4. Brisbane City Council: Library Checkouts (2023, 2024 and 2026)
    a. Author: Brisbane City Council
    b. Creation process: Annual library checkout records are published monthly and has information about checkout date, language, item type, etc.
    c. Link to dataset - 2021 dataset, 2023 dataset, 2024 dataset, 2025 dataset, and 2026 dataset
5. Creative Australia: National Arts Participation Survey 2025
    a. Author: Creative Australia

b. Creation process: Data was obtained through a national survey examining Australians' participation in arts and cultural activities, including reading preferences.
c. Link to dataset - here

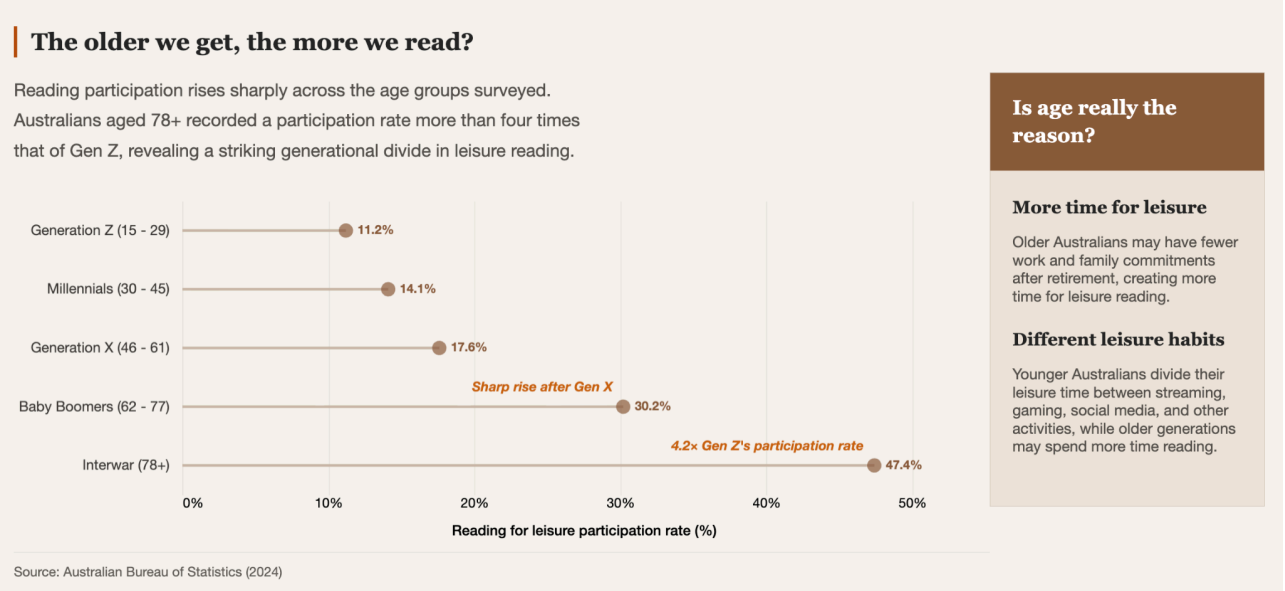

The main attributes are as follows:

Attribute	**Attribute type**	**Description and example**
Generation	Categorical nominal	Generational groups. Example: GenZ, Genx
Gender	Categorical nominal	Male or female
Reading participation	Quantitative	Percentage participating in leisure reading
Average reading time	Quantitative	Average reading time in hours
State	Categorical nominal	Victoria, Western Australia
Council	Categorical nominal	The Hills Shire, Boulia Shire
Total library loans	Quantitative	Number of books borrowed. Example 1.59 million
Loans per resident	Quantitative	Average annual loans per resident
Digital loan share	Quantitative	Digital loans as a percentage of population
Library membership rate	Quantitative	Registered members as a percentage of population
Reading category	Categorical nominal	Fiction, non-fiction, graphic novels, etc.
Year	Temporal	Financial year. Example 2024 to 2025
Language	Categorical nominal	Chinese, french, etc
Book discovery method	Categorical nominal	Word of mouth, social media

Describe the "How" aspect of your DV II

1. Idiom: Lollipop Chart

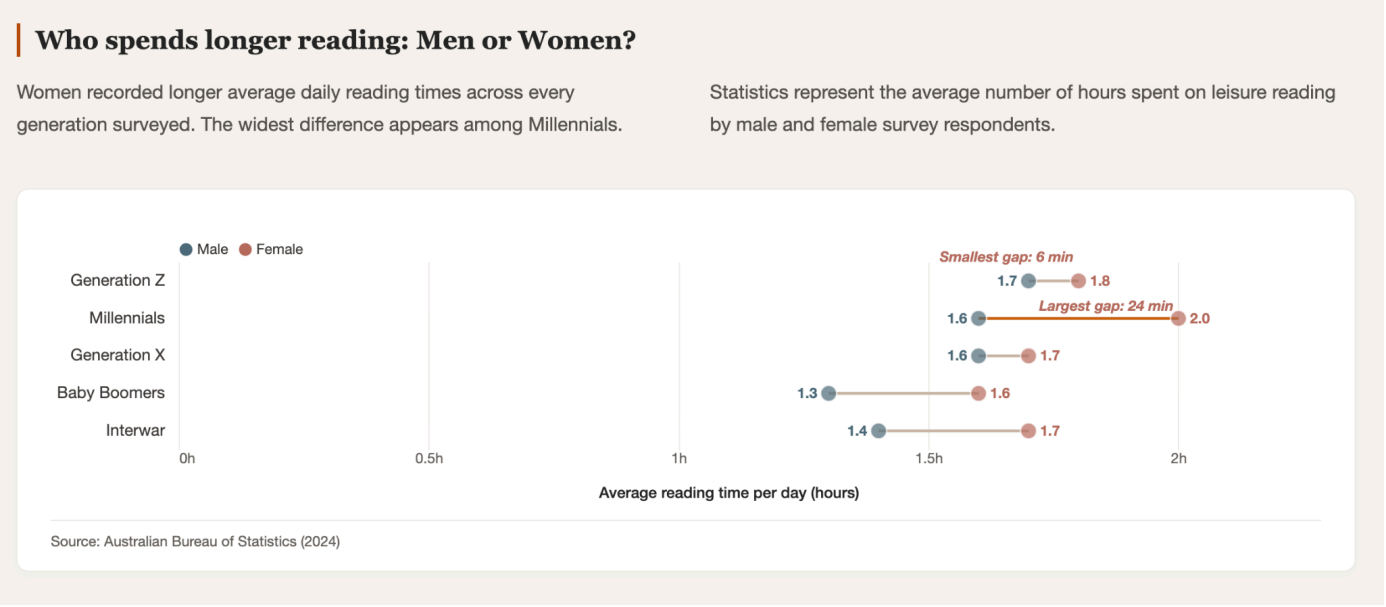

What it shows	Compares the percentage of Australians who participated in reading for leisure across five generations, from Generation Z (15 to 29) to the Interwar generation (78+)
Why it works	It's suitable for comparing the reading participation (a quantitative attribute) and generation (an ordered categorical attribute). The common horizontal scale makes it easy to compare the values
Mark	• Point mark - Each circle represents the reading participation rate of a generation • Line mark - The line connected the circle to the 0% baseline
Channel	• Horizontal position (x-axis) represents the reading participation rate (%) • Vertical position (y-axis) represents the generation • Size/length of the line represents the magnitude of the participation rate • Text label - displays the participation percentage for each generation

2. Idiom: Connected Dot Plot

What it shows	Compares the average daily reading time (in hours) between males and females

	across five Australian generations.
Why it works	In this chart we are comparing the average reading time for males and females within each generation. This connected dot plot allows us to easily identify the differences between the reading times of the two genders.
Mark	• Point mark represents the average reading time • Line mark connects the points and shows the difference in average reading time
Channel	• Horizontal position (x-axis) represents the average daily reading time in hours • Vertical position (y-axis) represents the generation • Color hue is used to differentiate between male and females • Text labels show the exact reading times

3. Idiom: Waffle Chart

What it shows	Compares public library members rates relative to population in New South Wales,Victoria and Western Australia. It shows the proportion of residents registered as library members versus those who are not registered.

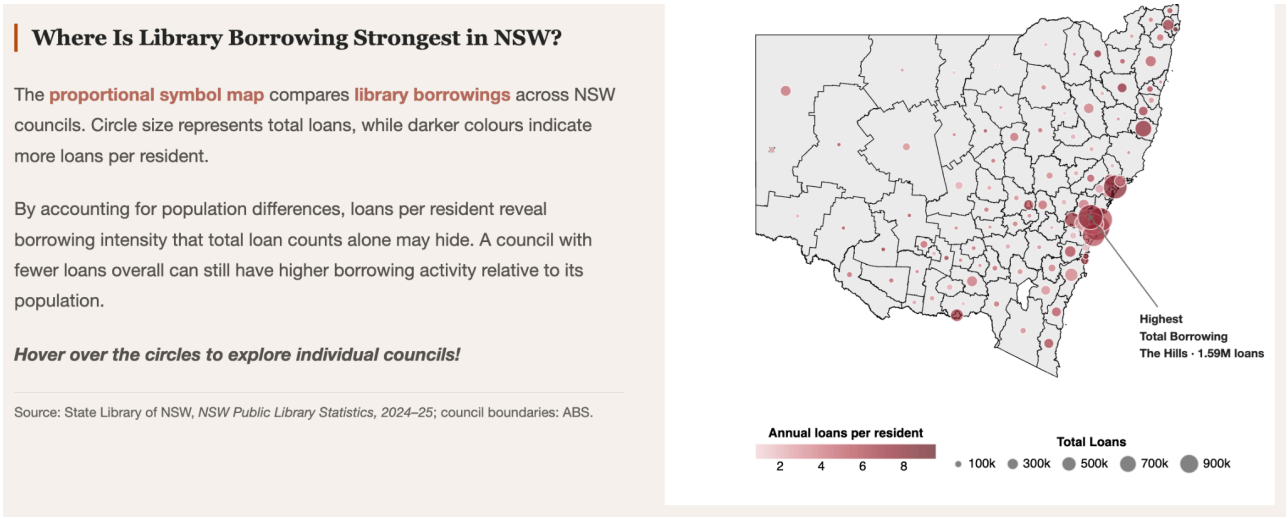

Why it works	It is used because it makes differences in membership rates easy to identify. The colored and uncolored squares also makes it easy to identify the proportion of residents who are registered library members.
Mark	• Area mark/ square mark - Each square represents 1% of the state's population
Channel	• Color hue: Pink represents registered library members and light grey represents unregistered members • Spatial position is used to represent the grid structure • Horizontal position (x-axis) represents the state • Text labels show the membership and non-membership percentages

4. Idiom: Proportional Symbol Map

What it shows	Compares public library borrowing across NSW local government areas and shows both total library loans and annual loans per resident.
Why it works	This is suitable for displaying quantitative data across geographical

	regions. The circle sizes allow readers to identify councils with higher total borrowing, while the colour gradient represents borrowing intensity relative to population.
Mark	• Point mark - Circles represent library borrowing within each council
Channel	• Circle size - Encodes total library loans, with larger circles representing higher borrowing volumes • Color luminance - Encodes annual loans per resident, with darker red indicating higher borrowing intensity.

5. Idiom: Dot Density Map

What it shows	Displays the geographical distribution of physical public library visits across NSW local government areas in 2024 to 25. Each dot represents 10,000 library visits.
Why it works	Dot density map works here because it allows readers to easily understand areas with higher and lower library visitation by just looking at the concentration of the dots.
Mark	• Point mark - each blue dot represents 10,000 library visits

Channel	• Dot density encodes the total number of library visits within each council • Color hue - the blue color dots distinguishes the 'visit' dots from the geographic map

6. Idiom: Choropleth Map

What it shows	Compares the proportion of digital loans relative to total public library loans across Queensland in 2024-2025
Why it works	It is suitable for comparing normalised quantitative data (which is the percentage of digital loans). The colors make it easy to identify regions with higher or lower digital borrowing shares for each council.
Mark	• Area mark is used to represent the Queensland council areas
Channel	• Color luminance is used to encode the percentage of digital loans. Darker orange indicates a higher digital borrowing share and

	lighter orange indicates a lower digital borrowing share. ● Text labels are used to highlight the council with the highest and the lowest digital borrowing shares

How Digital Is Library Borrowing in Queensland?

The **choropleth map** compares the **percentage of library borrowing conducted digitally** across Queensland councils in 2024–25.

These differences may reflect library accessibility, internet connectivity and local preferences. Digital borrowing may be especially valuable in communities with limited access to physical libraries.

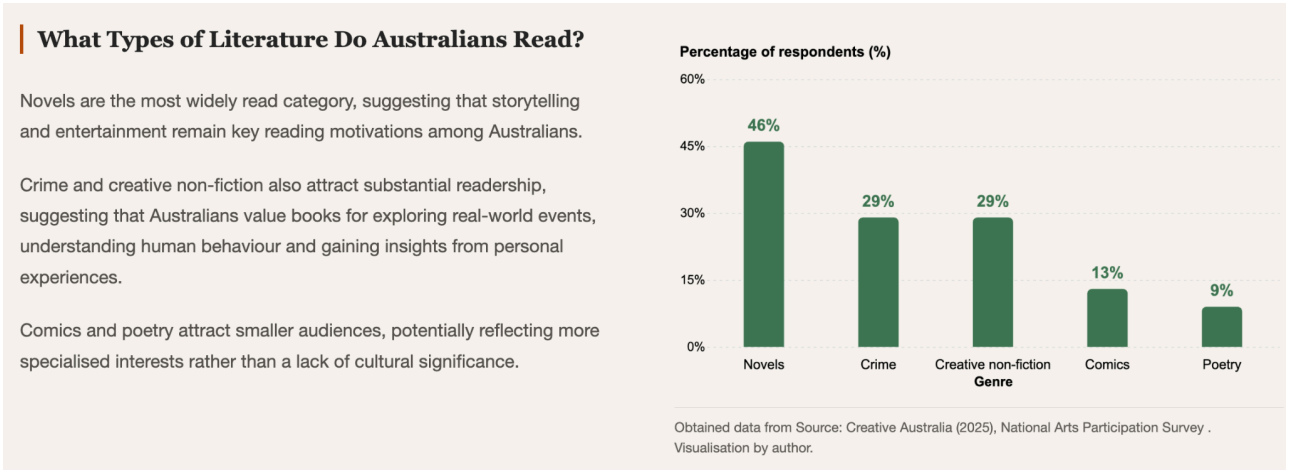

However, a higher digital percentage does not indicate greater overall library use, as it reflects the share of borrowing rather than total loan volumes.

Source: Queensland Government, *Queensland Public Libraries Annual Statistics, 2024–25.*

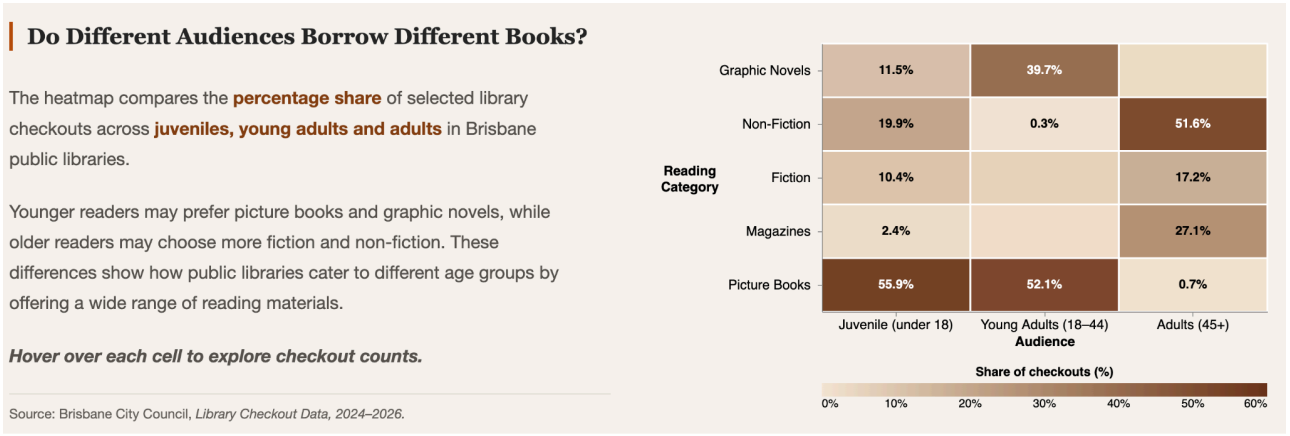

7. Idiom: Bar Chart

What it shows	Compare the percentage of Australians survey participants who read five different literature genres: novels, crime, creative non-fiction, comics and poetry.
Why it works	A bar chart is suitable because it is easy to compare the preferences of the survey respondents and identify which genre is more popular.
Mark	● Line mark - each bar represents a genre and its percentage of respondents.
Channel	● Horizontal position (x-axis) represents the five genres. ● Vertical position (y-axis) represents the percentage of respondents who read each genre. ● Bar length represents the readership percentage ● Text labels display the percentage of readers for each genre.

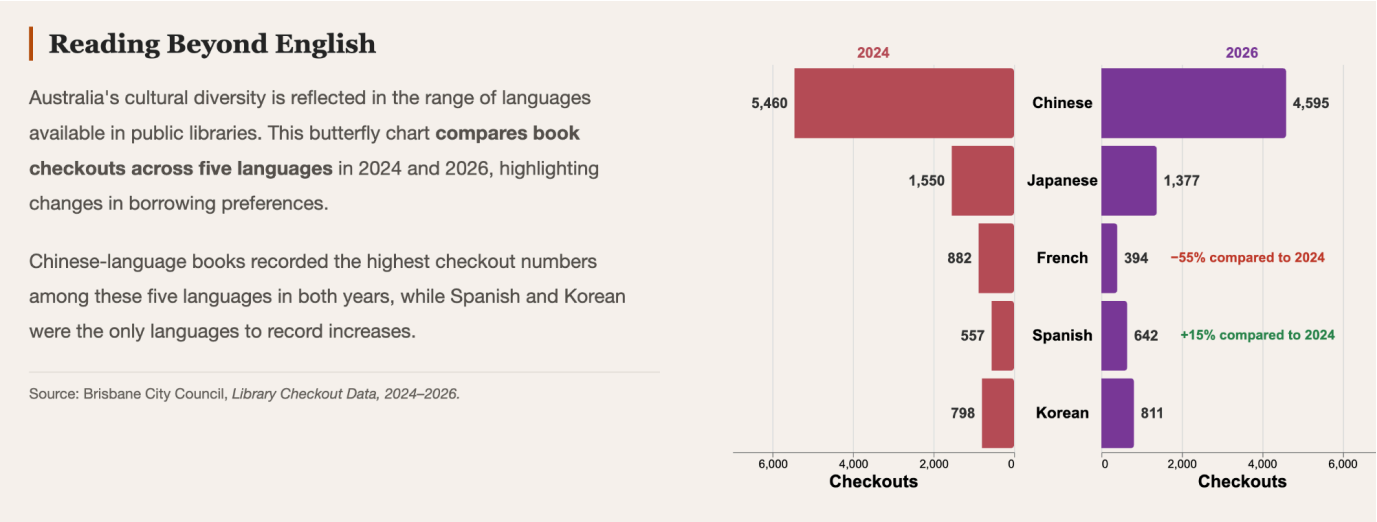

8. Idiom: Heatmap

What it shows	Compares the percentage share of library checkouts across five reading categories and three age groups: Juvenile (under 18), Young Adults (18 - 44), and Adults (45+)
Why it works	The heatmap is suitable for comparing two categorical attributes (reading category and audience group) against one quantitative measure (share of checkouts). The color luminance makes it easy to identify differences in reading preferences across age groups.
Mark	• Area mark - Each cell represents a combination of reading category and audience group.
Channel	• Horizontal position (x-axis) represents the three audience groups • Vertical position (y-axis) represents the five reading categories. • Color luminance encodes the percentage share of checkouts • Text labels is used to display the checkout percentage

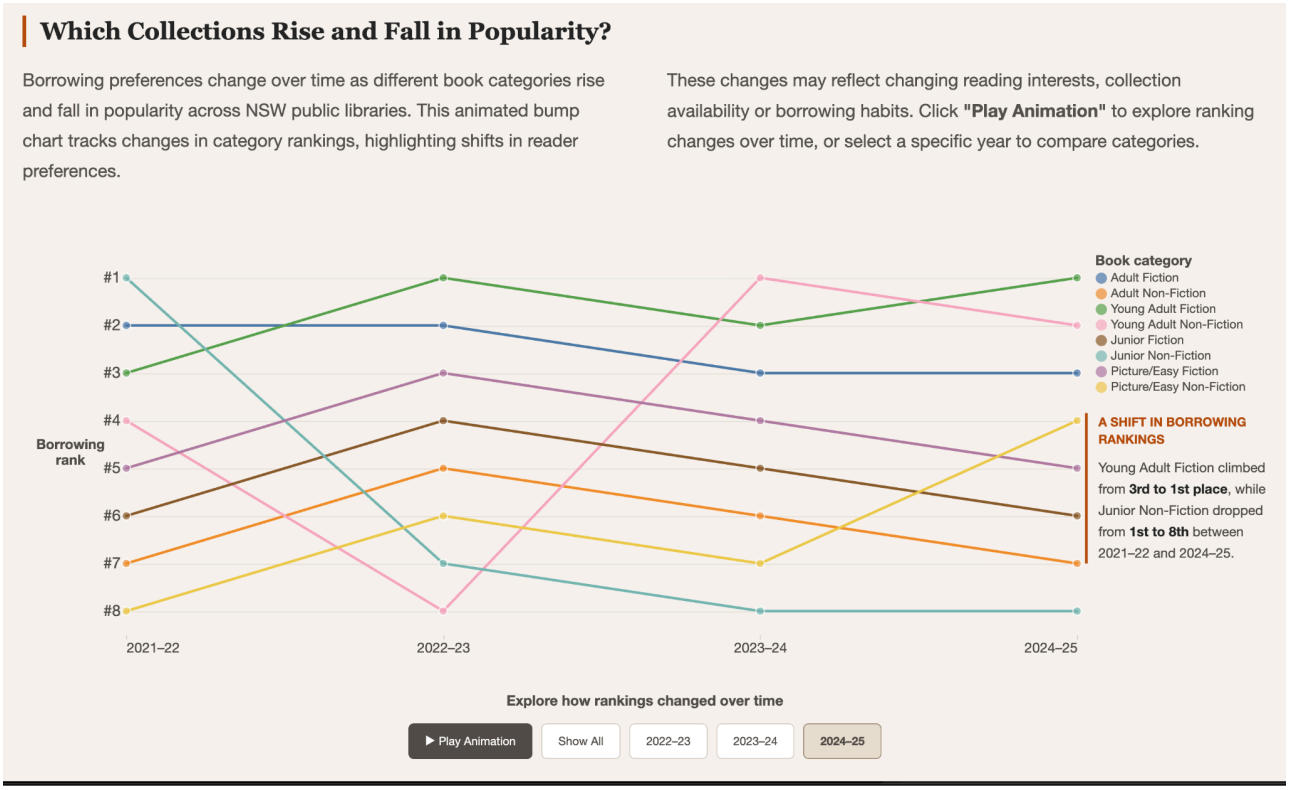

9. Idiom: Butterfly Chart

What it shows	Is used to compare the number of library book checkouts across five languages (Chinese, Japanese, French, Spanish and Korean) between 2024 and 2026
Why it works	It works well here because it allows readers to quickly compare checkout volumes for books of these different languages for the year 2024 and 2026.
Mark	• Line mark - Each bar represents the number of book checkouts for a particular language in one year.
Channel	• Horizontal position (x-axis) encodes the number of checkouts • Vertical position (y-axis) represents the different languages. • Bar length encodes the borrowing volumes • Color hue - purple used to represent borrowing volume in 2026 while red is used to show the borrowing volume in 2024.

10. Idiom: Bump Chart

What it shows	Shows how the borrowing rankings of eight book categories in NSW public libraries changed across four financial years, from 2021- 22 to 2024 - 25.
Why it works	A bump chart is suitable for visualising changes in rankings over time. It allows readers to clearly understand how the book's ranking has changed over the years.
Mark	• Line mark - Connect the borrowing rankings of each book category across different years • Point mark - the circles represent the ranking for each category
Channel	• Horizontal position (x-axis) represents the years • Vertical position (y-axis) represents the borrowing rank • Color hue is used to distinguish the 8 book categories

11. Idiom: Radial Bar Chart

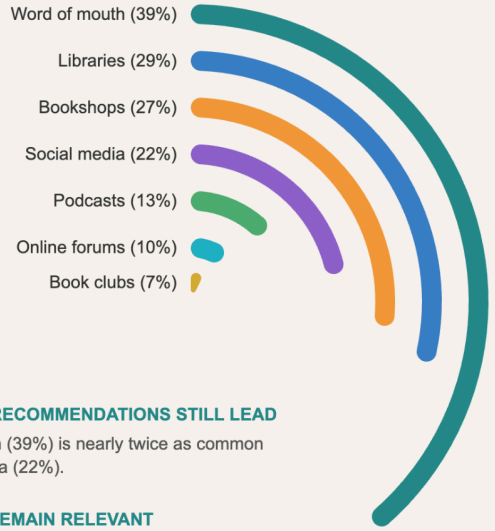

What it shows	The radial bar chart shows how Australians discover books through different methods.
Why it works	The radial bar chart easily allows readers to see which discovery method is most and least popular by looking at the length of the arc.
Mark	• Bar/ line mark - each curved bar represents a book discovery method and its corresponding percentage
Channel	• Arc length represents the percentage of respondents using each discovery method • Color hue distinguishes the different discovery methods using different colors • Text labels display the exact percentages and identify the discovery methods.

Where Do Australians Find Their Next Read?

The popularity of word of mouth may reflect readers' preference for recommendations from people who understand their interests. Unlike social media, where book suggestions compete with large volumes of content, personal recommendations can offer a more targeted approach to discovery. This suggests that trust and personal relevance may matter more than online visibility when choosing what to read next.

Respondents could select multiple discovery methods, so percentages do not add up to 100%.

Source: Creative Australia, *National Arts Participation Survey (2025)*.

PERSONAL RECOMMENDATIONS STILL LEAD

Word of mouth (39%) is nearly twice as common as social media (22%).

LIBRARIES REMAIN RELEVANT

Libraries (29%) exceed social media (22%) by 7 percentage points.

Comic	6.4	42.6	10.3
Magazine	13.9	7.3	2.7

AGE

Reading Beyond English

Part D: Screenshot of your visualization

Australia, Between the Pages

Exploring who reads, what Australians borrow, and how books connect communities.

Introduction

Every page tells a story. From magical worlds to gripping mysteries, books take us places and bring us together. But what gets Australia reading? Which genres appeal to different generations? And does where we live shape what we love to read?

Australia, Beyond the Pages explores how reading habits vary across Australian generations and communities. Using national reading trends and public library data, it reveals patterns in reading participation, library engagement, and book preferences.

READING INSIGHT 03

32% digital loans

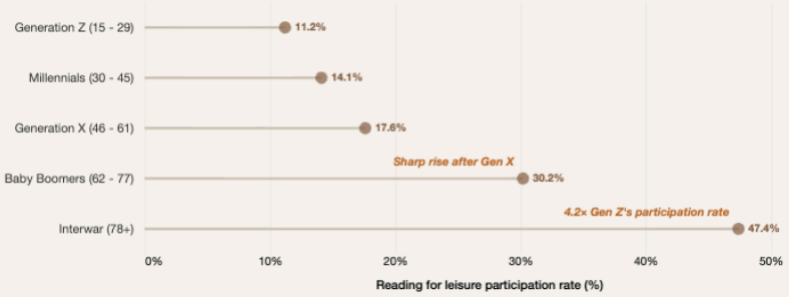

Click to uncover the fact.

01 - The *People* Behind the Pages

This section explore how age & gender influence reading habits.

The older we get, the more we read?

Reading participation rises sharply across the age groups surveyed. Australians aged 78+ recorded a participation rate more than four times that of Gen Z, revealing a striking generational divide in leisure reading.

Source: Australian Bureau of Statistics (2024)

Is It Age, or Lifestyle?

More time for leisure

Older Australians may have fewer work and family commitments after retirement, creating more time for leisure reading.

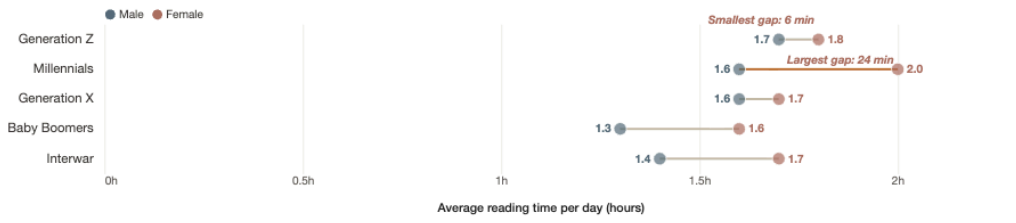

Different leisure habits

Younger Australians divide their leisure time between streaming, gaming, social media, and other activities, while older generations may spend more time reading.

Who spends longer reading: Men or Women?

Women recorded longer average daily reading times across every generation surveyed. The widest difference appears among Millennials.

Statistics represent the average number of hours spent on leisure reading by male and female survey respondents.

Source: Australian Bureau of Statistics (2024)

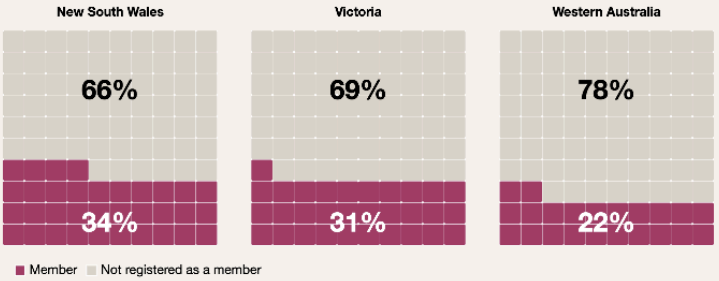

02 - Reading Across *Communities*

Across Australia, public libraries connect communities with books, resources and shared spaces. Yet the ways people engage with these services differ from place to place.

From library membership and borrowing activity to physical visits and digital collections, this chapter explores how public library engagement varies across Australian communities.

Does Library Membership Vary Across States?

Library membership rates vary across the three states, with **New South Wales** recording the highest rate **(34%)** & **Western Australia** the lowest **(22%)**. This **12% point gap** highlights differences in library registration relative to population. However, membership does not capture all library use. Residents can still visit libraries for study, events and community services without being registered members.

Sources: State Library of New South Wales, Public Libraries Victoria, and State Library of Western Australia (2024–25).

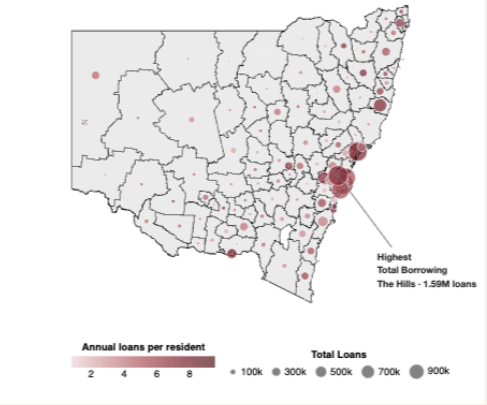

Where Is Library Borrowing Strongest in NSW?

The **proportional symbol map** compares **library borrowings** across NSW councils. Circle size represents total loans, while darker colours indicate more loans per resident.

By accounting for population differences, loans per resident reveal borrowing intensity that total loan counts alone may hide. A council with fewer loans overall can still have higher borrowing activity relative to its population.

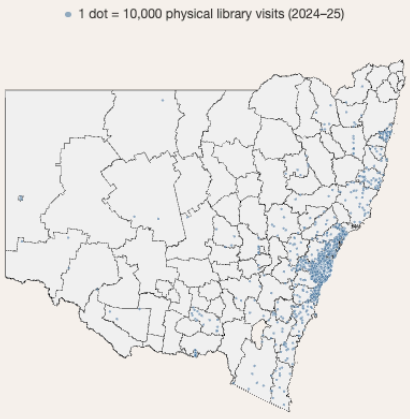

Hover over the circles to explore individual councils!

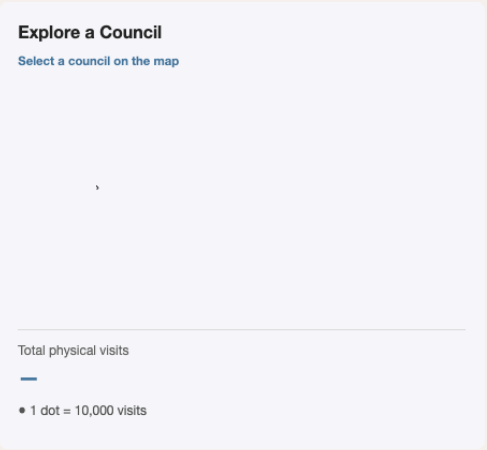

Source: State Library of NSW, *NSW Public Library Statistics, 2024–25*; council boundaries: ABS.

Where Are NSW Libraries Most Visited?

The **dot map** represents **library visits across NSW councils** in **2024 to 2025** . It highlights how frequently communities use library spaces. Visits are concentrated around Sydney and coastal NSW, reflecting higher population density and library accessibility. However, total visits do not indicate engagement per resident, particularly in smaller regional communities. ***Click a council to see the statistics closer!***

How Digital Is Library Borrowing in Queensland?

The **choropleth map** compares the **percentage of library borrowing**

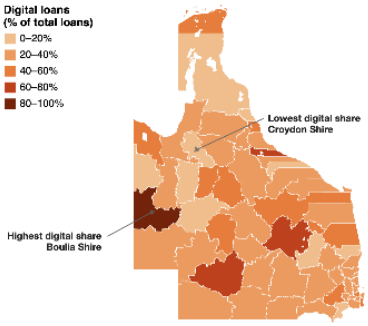

How Digital Is Library Borrowing in Queensland?

The **choropleth map** compares the **percentage of library borrowing conducted digitally** across Queensland councils in 2024–25.

These differences may reflect library accessibility, internet connectivity and local preferences. Digital borrowing may be especially valuable in communities with limited access to physical libraries.

However, a higher digital percentage does not indicate greater overall library use, as it reflects the share of borrowing rather than total loan volumes.

Source: Queensland Government, *Queensland Public Libraries Annual Statistics, 2024–25.*

03 - The *Books* We Choose

Beyond library engagement, the books Australians choose reveal diverse interests and reading preferences.

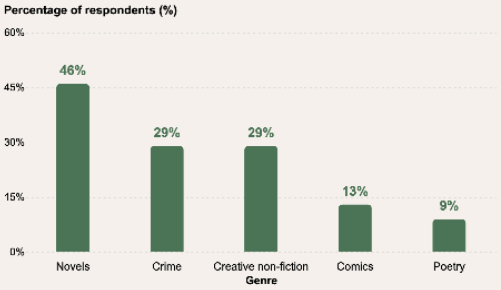

This chapter explores what Australians read, how preferences differ across audiences, and how borrowing trends change over time.

What Types of Literature Do Australians Read?

Novels are the most widely read category, suggesting that storytelling and entertainment remain key reading motivations among Australians.

Crime and creative non-fiction also attract substantial readership, suggesting that Australians value books for exploring real-world events, understanding human behaviour and gaining insights from personal experiences.

Comics and poetry attract smaller audiences, potentially reflecting more specialised interests rather than a lack of cultural significance.

Obtained data from Source: Creative Australia (2025), National Arts Participation Survey . Visualisation by author.

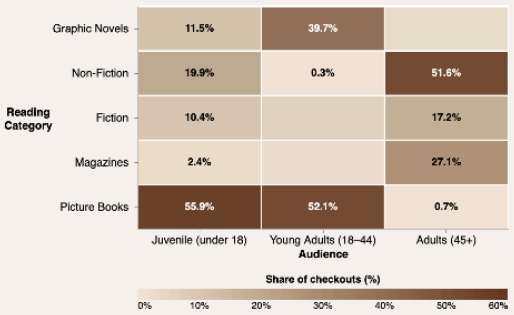

Do Different Audiences Borrow Different Books?

The heatmap compares the **percentage share** of selected library checkouts across **juveniles, young adults and adults** in Brisbane public libraries.

Picture books account for the highest share **(55.9%)** among juveniles, while **non-fiction** records the lowest share **(0.3%)** among young adults. These differences show how public libraries cater to different age groups by offering a wide range of reading materials.

Hover over each cell to explore checkout counts.

Source: Brisbane City Council, *Library Checkout Data, 2024–2026.*

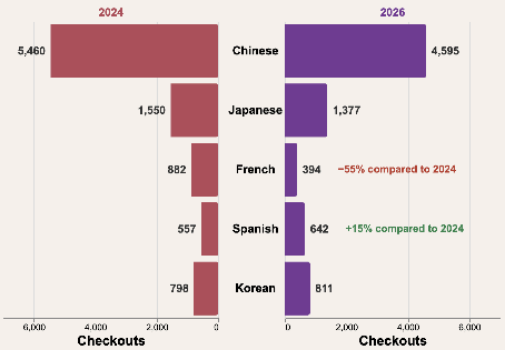

Reading Beyond English

Australia's cultural diversity is reflected in the range of languages available in public libraries. This butterfly chart **compares book checkouts across five languages** in 2024 and 2026, highlighting changes in borrowing preferences.

Chinese-language books recorded the highest checkout numbers among these five languages in both years, while Spanish and Korean were the only languages to record increases.

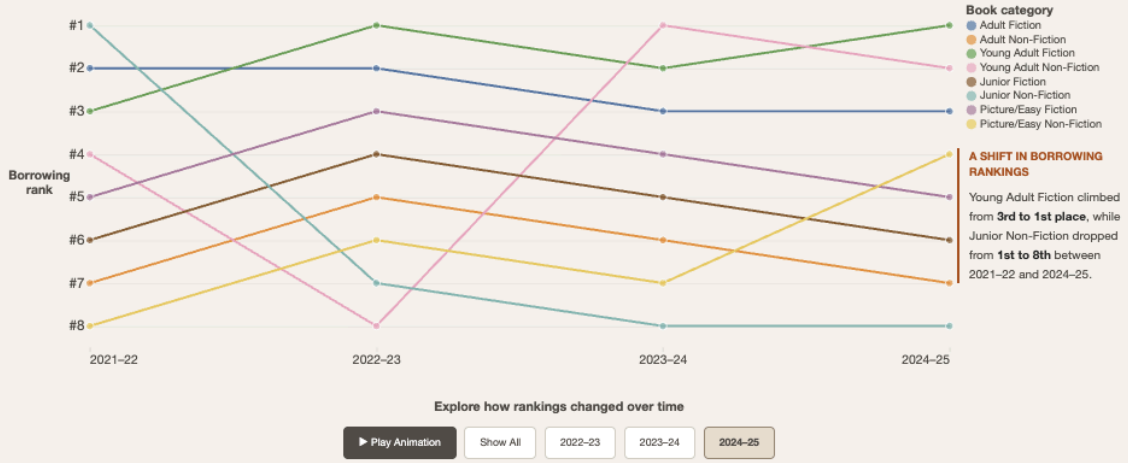

Source: Brisbane City Council, *Library Checkout Data, 2024–2026.*

Which Collections Rise and Fall in Popularity?

Borrowing preferences change over time as different book categories rise and fall in popularity across NSW public libraries. This animated bump chart tracks changes in category rankings, highlighting shifts in reader preferences.

These changes may reflect changing reading interests, collection availability or borrowing habits. Click **"Play Animation"** to explore ranking changes over time, or select a specific year to compare categories.

Explore how rankings changed over time

04 - How Do Australians *Discover* Books?

Readers discover books through a variety of channels, including personal recommendations, libraries, bookshops and digital platforms.

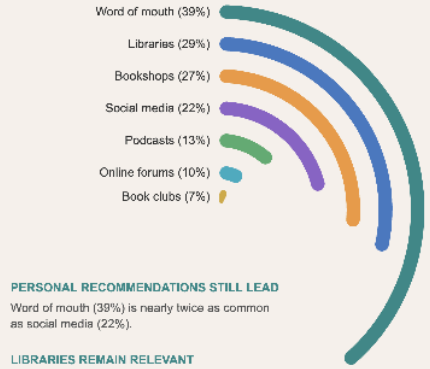

As social media become part of book discovery, how do they compare with traditional sources such as word of mouth and libraries?

Where Do Australians Find Their Next Read?

The popularity of word of mouth may reflect readers' preference for recommendations from people who understand their interests. Unlike social media, where book suggestions compete with large volumes of content, personal recommendations can offer a more targeted approach to discovery. This suggests that trust and personal relevance may matter more than online visibility when choosing what to read next.

Respondents could select multiple discovery methods, so percentages do not add up to 100%.

Source: Creative Australia, *National Arts Participation Survey (2025).*

Conclusion

Australia's reading habits are changing, but the importance of reading extends beyond the books themselves. From older generations showing greater reading participation to word of mouth influencing **39% of book discoveries**, the data reveals how age and personal connections shape reading choices.

Meanwhile, libraries continue to connect communities through both physical and digital services. Together, these patterns suggest that the future of reading is not simply about choosing between print and digital, but about making books accessible and meaningful to different generations and communities.
